crystal itself, for example a site with tetragonal-type symmetry could be found in a cubic lattice. an example of this situation: space group #217, site 12d has symmetry “-4..” which is a tetragonal point group (4-fold axis), even though space group 217 is for cubic crystals.

and their symmetry. 1 introduction up to this point, the focus of our course has been on understanding the static properties of crystals. in doing this, we have heavily exploited the symmetry of the crystals — in particular secular equation in a molecule or a crystal with a symmetry group fgg, e.g., a normal mode of vibration of the
