4. the use of matched sampling and regression adjustment to remove bias in observational studies 81 donald b. rubin (1973) 5. assignment to treatment group on the basis of a covariate 99 donald ?. rubin (1977) part iii. basic theory of multivariate matching 115 6. multivariate matching methods that are equal percent bias reducing, i: some

matching methods for causal inference: a review and a look

matching methods for causal inference: a review and a look forward elizabeth a. stuart abstract. when estimating causal effects using observational data, it is desirable to replicate a randomized experiment as closely as possible by obtaining treated and control groups with similar covariate distributions. this

use of matching methods for causal inference in

while the decomposition of causal effects into multiple causal pathways is an important topic for future research (e.g., pearl 2000), its comprehensive treatment is beyond the scope of our article nevertheless, we partially address this question by modeling causal heterogeneity in the fifth section. finally, to complete the survey, voters were asked to

matching and weighting methods for causal inference

matched sampling for causal effects (cambridge up) kosuke imai (princeton) matching and weighting methods duke (january 18 – 19, 2013) 18 / 57. how to check balance success of matching method depends on the resulting balance how should one assess the balance of matched data?

matched sampling methods to reduce bias in an

methods for drawing causal inferences from observational data are described in this document. matched sampling techniques are employed to reduce bias between experimental and control groups in an effort to isolate the effect of early childhood exposure to poverty on an individual's educational attainment.

causal inference by minimizing the dual norm of bias

existing causal estimators belong to this family, including one-to-one matching (with or without replacement), coarsened exact matching, and mean-matched sampling. we propose a range of new, kernel-based matching and weighting estimators that arise when one minimizes the dual norm of the bias with respect to a reproducing kernel hilbert space.

using statistics to determine causal relationships

if the unit were exposed to treatment a at time t_1 , and the cholesterol level that would be observed if the unit were exposed to treatment b at time t_1 . let's denote these outcomes as y_{ua} and y_{ub} , respectively. the only distinction between y_{ua} and y_{ub} is exposure to different treatments; so, the only explanation of any difference between y_{ua} and y_{ub} is a difference in the effects of the two

a framework for optimal matching for causal inference

a matched sample out of pairs of treated and control subjects so that the total pairwise distance between co-variate vectors is small or even minimal, mimicking a randomized matched-pair experiment [12]. if we allow subjects to be paired with replacement, we can have a sample with duplicates, resulting in weights that cor-
